Multi-National Food Producer Chooses 650 AML to Enhance Filling Operations

Challenge

Background
At a food manufacturing plant, containers are filled using equipment with multiple filling heads that use an air cylinder to open and close filling tube valve.

Multiple filling heads must deliver a precise quantity of product into the container. Cylinder lag time causes variance in fill weights.

Due to frequent washings, water was able to get past cylinder wipers into the cylinder. This resulted in corrosion and gum formation that caused actuation delays.

Solution

Product
A local representative recommended Chesterton 650 Advanced Machinery Lubricant, a pneumatic lubricant for its water absorption capabilities. Its excellent emulsification characteristics can absorb water in the pneumatic systems, avoiding corrosion and residue formation.

The in-line lubrication system was cleaned of the old white oil, and water was drained from filters. 650 AML was filled in the top oil bowl of the pneumatic lubrication system.

Results

• The 650 AML has been in operation for 12+ weeks without any issues.
• Actuators have been working flawlessly and no line stoppage has been observed.
• Solenoid valves did not need any repair or replacement.
• Fill weights and final packaging specs have been accurate.

High speed filling line. 

650 AML was simply added into the in-line oiler.

Enhanced reliability with 650 AML insures a smooth operation.
